

1. Introduction:

As we face the growing threat of climate change, Microsoft, a global leader, must set the highest standard of responsibility.

2. Position:

Microsoft is falling short by focusing primarily on its offices, while failing to address the emissions from its supply chain.

3. Reason:

A commitment to sustainability requires tackling the emissions in every aspect of your business - especially in the supply chain that fuels your operations.

4. Challenge:

Some might argue that Microsoft is taking necessary steps internally, and that supply chain reforms are too complex to tackle.

5. Rebuttal:

Leadership isn't about what's easy. It's about doing what's right. Microsoft must engage its suppliers and insist on greener practices.

6. Conclusion:

Microsoft has the power to influence global change. They must extend their carbon reduction efforts to its supply chain.
